

Runner.ai Architecture Handbook

Chapter 1: Overview

Runner.ai is a personal AI research platform. The executor runs read-only tools autonomously.

Chapter 2: The Executor

The executor runs tool calls in parallel where independent. It applies per-tool timeouts of 30 seconds.

It retries transient failures with exponential backoff.

Chapter 3: Retrieval

Documents are chunked by ~1200 characters with 180 character overlap.

Chunks are embedded and stored in a vector store scoped by user_id.

Chapter 4: Grounding

Every answer must cite retrieved evidence. The synthesizer refuses to answer from general knowledge.
